EDUCATION

Stevens Institute of Technology

Master of Science in Computer Science - 3.52/4.0

Sep. 2023 – May 2025

Hoboken, NJ

Vellore Institute of Technology

Bachelor of Technology (B.Tech) in Computer Science - 8.38/10.0

May 2019 – Jun. 2023

Vellore, India

WORK EXPERIENCE

GimmieAI

May 2025 – Present

Fullstack Engineer

Remote

- Built Gimmie's AI product search, a Claude planning service that turns a query and a gift personality profile into retailer specific keyword plans, fans out in parallel to Amazon, Etsy, Shopify, Poshmark, and Target, and unifies results into one typed product model with cross retailer dedup, per retailer regeneration, and fingerprint keyed caching.
- Delivered Pinterest personalization end to end, OAuth 2.0 with encrypted token storage, consent gated board syncing, a GPT vision pipeline that distills pins into a taste profile, a public taste showcase secured by PostgreSQL row level security, and a visual search that turns a single pin image into a cross retailer product search with zero image retention.
- Shipped the React Native app's growth and platform features, contact discovery with phone matching through PostgreSQL functions, referral invites with Branch deep link attribution and push notifications, Google Calendar sync over OAuth 2.0, SMS and marketing consent controls, data export, and account deletion.
- Engineered the MVP of Gimmie's merchant side, a Shopify SaaS chat widget, with a LangGraph agent architecture, cross origin OAuth across two Supabase projects, Shopify Billing with three tier plans and usage based commission automated through GitHub Actions, and atomic usage limits enforced through PostgreSQL functions.

Allyvia

Aug. 2025 – Jan. 2026

Fullstack Engineer (Contract)

Remote

- Architected the QuickBooks integration for 10 plus financial entity types, a three tier sync of real time webhooks, nightly change data capture, and manual refresh, orchestrated through AWS SQS queues and dedicated workers with idempotent processing, so duplicate or out of order deliveries converge to the same state.
- Built the financial platform end to end, a React and TypeScript frontend on a Django REST backend, with role based access control, JWT authentication, trigram similarity search, multi field filtering, and server side pagination across all entity views.
- Developed an LLM powered insights system that analyzes vendor spend distribution and inventory velocity to flag supplier concentration risk and overstock, producing prioritized recommendations.

Okada & Company

Jul. 2025 – Aug. 2025

Frontend Engineer (Contract)

Manhattan, NY

- Architected enterprise-grade authentication system using React, TypeScript, Redux Toolkit, and React Router with JWT token management, automatic refresh handling via Axios interceptors across API endpoints, and secure cookie-based persistence implementing master-only login flow.
- Designed and implemented centralized Redux state management architecture migrating from local React state to establish a single source of truth with memoized selectors handling authentication, email management, client data caching, and UI state across 20+ components.
- Built reusable component library translating Figma designs into a comprehensive design system featuring DataTable with pagination, React Toastify notifications, composition-based page layouts, and custom Tailwind CSS styling system across 15+ application pages.

ACHIEVEMENTS

2nd in Folio Hackathon for MarketAutomator | Next.js, Supabase, Vercel-AI SDK, API Integrations

[link](#) | [videolink](#)

- Engineered a multi-agent AI platform leveraging LLMs to automate end-to-end marketing campaign creation, integrating Canva design analysis, content generation, and multi-channel distribution (Mailchimp, GitHub Pages, Notion) via a unified dashboard.
- Designed and implemented a scalable, modular architecture with specialized agents (Orchestrator, Brand, Content, Technical, Refinement) for visual context extraction, brand consistency, and natural language-driven campaign refinement, using Next.js 14, TypeScript, and Supabase for secure authentication and real-time streaming.
- Reduced campaign deployment time by 90% for small businesses by developing visual-first AI workflows, OAuth integrations for 5+ platforms, and robust error handling.

PROJECTS

LeaseConnect | TypeScript, React, Redux, GraphQL, MongoDB

[link](#)

- Built a full-stack subleasing platform on TypeScript, React, Redux, GraphQL, and MongoDB with JWT refresh-token authentication, Zod-validated multi-step listing onboarding via React Hook Form, Google Places autocomplete for geocoding, Cloudinary CDN image uploads, and GraphQL-composed search and filtering backed by indexed MongoDB queries returning paginated results by location, price, date, and amenities.

TECHNICAL SKILLS

JavaScript, TypeScript, Python, SQL, HTML5, CSS, React, React Native, Next.js, Redux, Zustand, TanStack Query, Tailwind CSS, React Hook Form, Zod, Node.js, Express.js, FastAPI, Web Services, Functional Programming, Data Structures, Algorithms, REST APIs, GraphQL, Socket.IO, PostgreSQL, MongoDB, Supabase, Firebase, LangChain, LangGraph, LLM APIs, Claude Code, CI/CD, Jest, React Testing Library, Git, Postman, JIRA, Agentic AI, Django, AWS SQS
